

# **TIDE TOOL: SOFTWARE TO ANALYZE GTS SEA-LEVEL DATA**

**Stuart A. Weinstein<sup>1</sup>, Laura S.L. Kong<sup>2</sup> and Dailin Wang<sup>1</sup>**

**<sup>1</sup> Pacific Tsunami Warning Center , NOAA/NWS, USA**

**<sup>2</sup> International Tsunami Information Center/UNESCO-NOAA, USA**

## **GTS – Global Telecommunications Service:**

**Maintained by the WMO and is comprised of a network of surface and satellite based telecommunications links and centers. It is a system for the global exchange of meteorological, climatic, seismic and other data to support multipurpose early warning and forecast systems\*.**

**The TWCs (Tsunami Warning Centers) rely heavily on the GTS to supply sea-level data in near real time from ~600 sea-level stations world wide and to transmit Tsunami Bulletins.**

**\*Source: <http://www.wmo.ch/pages/prog/drr/events/humanitarian/Documents/HumanitarianBackground%20document.pdf>**

**GOESW**

**CHANNEL 96**

**Hiva Oa**

**Downloaded at Wallops Island VA/USA and forwarded to the US TWCs and Met. Offices.**

**GTS Sea-Level Data is structured in a rich variety of formats. There are approximately 12 or so basic formats, with a number of variations.**

**UHSLC format (Hiva Oa, Marquesas)      Readable ASCII (XMT 5min)**

**SEHI40 KWAL 260032**

**9322451A 299003218 :PRS 1 #1 1879 1853 1832 1831 .....

**As you can see, GTS Sea-Level Data does not come gift wrapped and easy to use.**

**For a TWC to use GTS Sea-Level Data, the TWC needs (at minimum):**

- 1. Access to GTS Data!**  
(Easier said than done in many cases)
- 2. A Decoder to translate Sea-Level messages into sea-level data.**
- 3. A MetaData Database (used by the decoder).**

# Tide Tool

**Was originally developed to give BMG (Jakarta) a nascent capability to decode GTS sea-level messages from Indian Ocean and nearby Pacific Ocean sea-level stations back in Nov. 2005.**

**Tide Tool has grown in sophistication and is now used as an operational sea-level processing system at PTWC and a number of other centers**

# Tide Tool

**Tide Tool continuously decodes sea-level messages in real-time and displays the time series using the open source, platform independent, graphical scripting language Tcl/Tk.**

**Tide Tool consists of two main parts:**

- 1. Decoder which reads log files of GTS sea-level messages and a sea-level station metadata base.**
- 2. Dynamic map based clients that allow the user to select a single station or a group of stations to display and analyze.**

# Tide Tool Requirements

In order to decode GTS messages, run the dynamic map clients and display the time series, the following are required\*:

- Computer running Tcl/Tk software with BLT extension.
- GTS Sea level messages that are continuously archived into a log file.
- Tide.tcl and client Tcl/Tk scripts.  
(contains decoder and creates marigram displays)
- Sea-level Station metadata.
- A link to GTS data via the country's Met Service.

# Tide Tool

## COMP\_META metadata database\*

PTWC actively maintains a database (COMP\_META) of all sea-level stations that transmit sea-level messages via the GTS. Tide Tool reads a *dump* of this database to understand how sea-level messages are structured for the various sea-level stations.

manz	Manzanillo_MX	3541502E	SEPA40	prs	1	10	M	3	-1	1.0000
005 0000	19.0558 -104.3176	1	UHSLC	163	PARSE_GLOSS					
manz	Manzanillo_MX	3541502E	SEPA40	rad	1	10	M	3	-1	1.0000
005 0000	19.0558 -104.3176	1	UHSLC	163	PARSE_GLOSS					

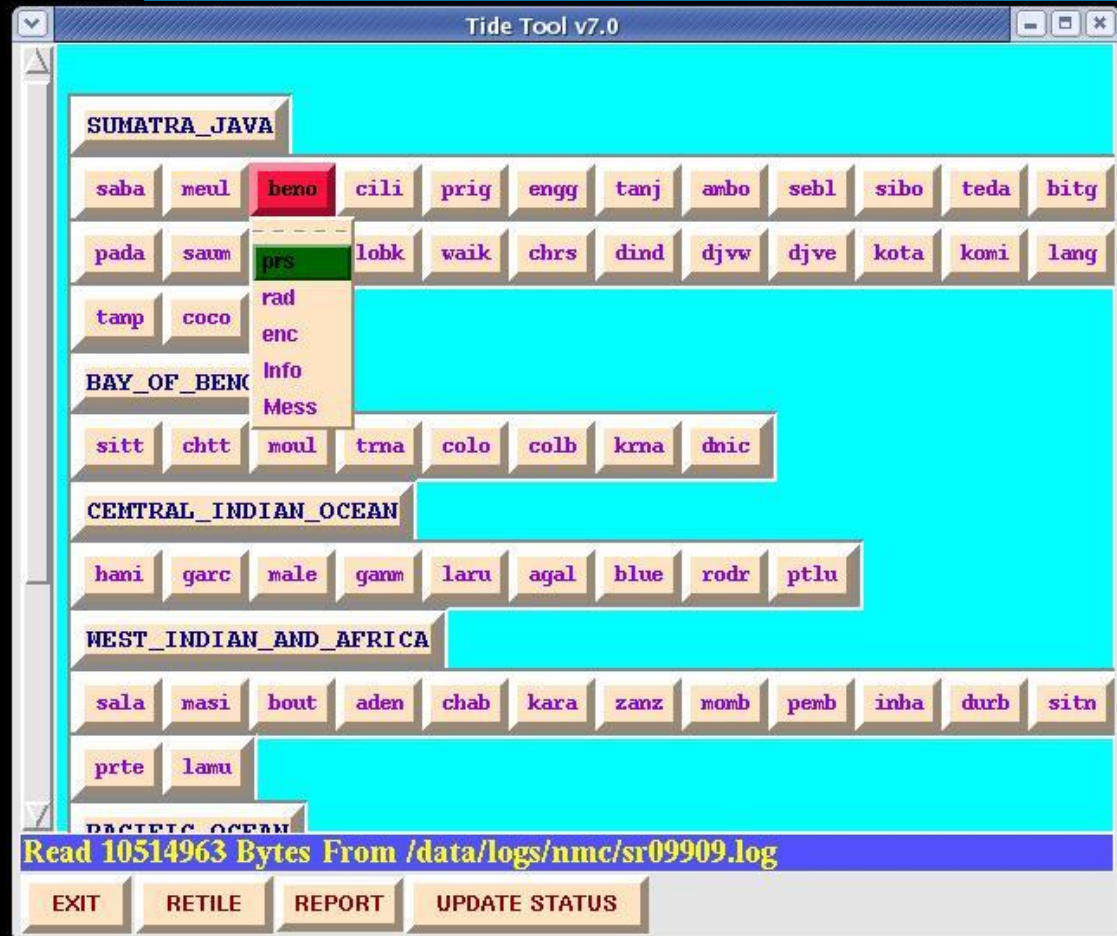

The COMP\_META database has ~1800 entries

# Tide Tool Decoder (Tide.tcl script)

- Reads and decodes GTS sea-level messages from the logfile.
- Constructs the main GUI which responds to mouse clicks.
- Sends and services instructions to and from clients respectively.
- Supports multiple clients via sockets.
- Creates transmission report and determines status of stations.
- Scrollable.

# Tide Tool Monitor Widget

- Can display up to three different time series:

**Red** – Actual time series

**Black** – De-tided time series

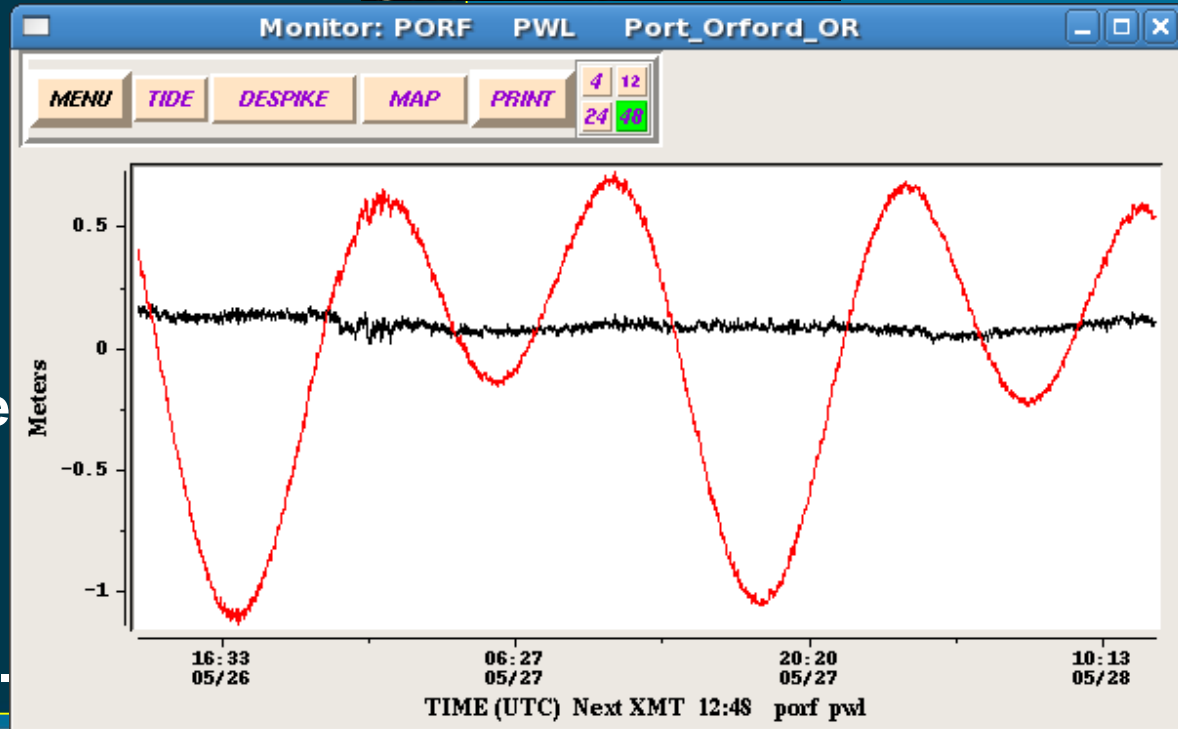

**Blue** -- Predicted time series

- Two de-tiding options: permanent or on-the-fly coefficients.

- Despike option based on three point median.

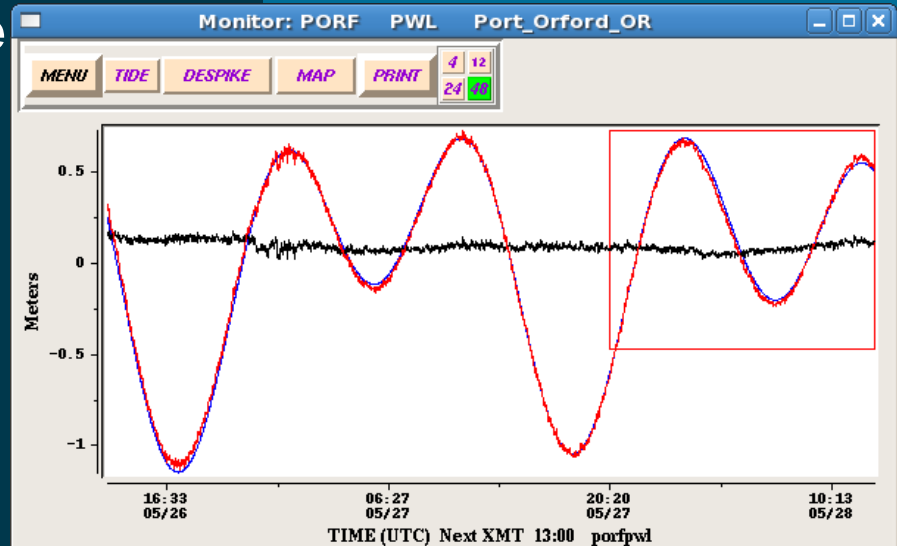

- Station location map option showing reverse travel-time contours.

- Rubber banding zoom option to expand time series.

# Tide Tool Zoom Widget

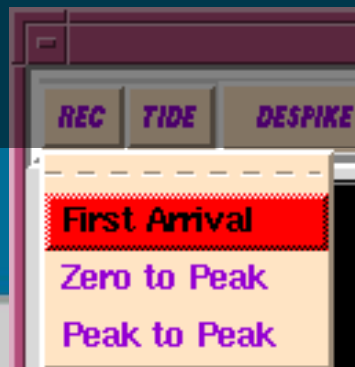

- Used to measure tsunami wave arrival time, amplitude, and period with mouse clicks and record measurements in a file. Can zoom recursively
- Can display up to three different time series:
  - Red** – Actual time series
  - Black** – De-tided time series
  - Blue** -- Predicted time series
- Two de-tiding options: permanent or on-the-fly coefficients.
- De-spike option based on three point median.

# Tide Tool Zoom Widget

- Used to measure tsunami wave arrival time, amplitude, and period with mouse clicks and record measurements in a file. Can zoom recursively.
- Can display up to three different time series:
  - Green** – Actual time series
  - White** – De-tided time series
  - Blue** -- Predicted time series
- Two de-tiding options: permanent or on-the-fly coefficients.
- De-spike option based on three point median.

REC TIDE DESPIKE

First Arrival  
Zero to Peak  
Peak to Peak

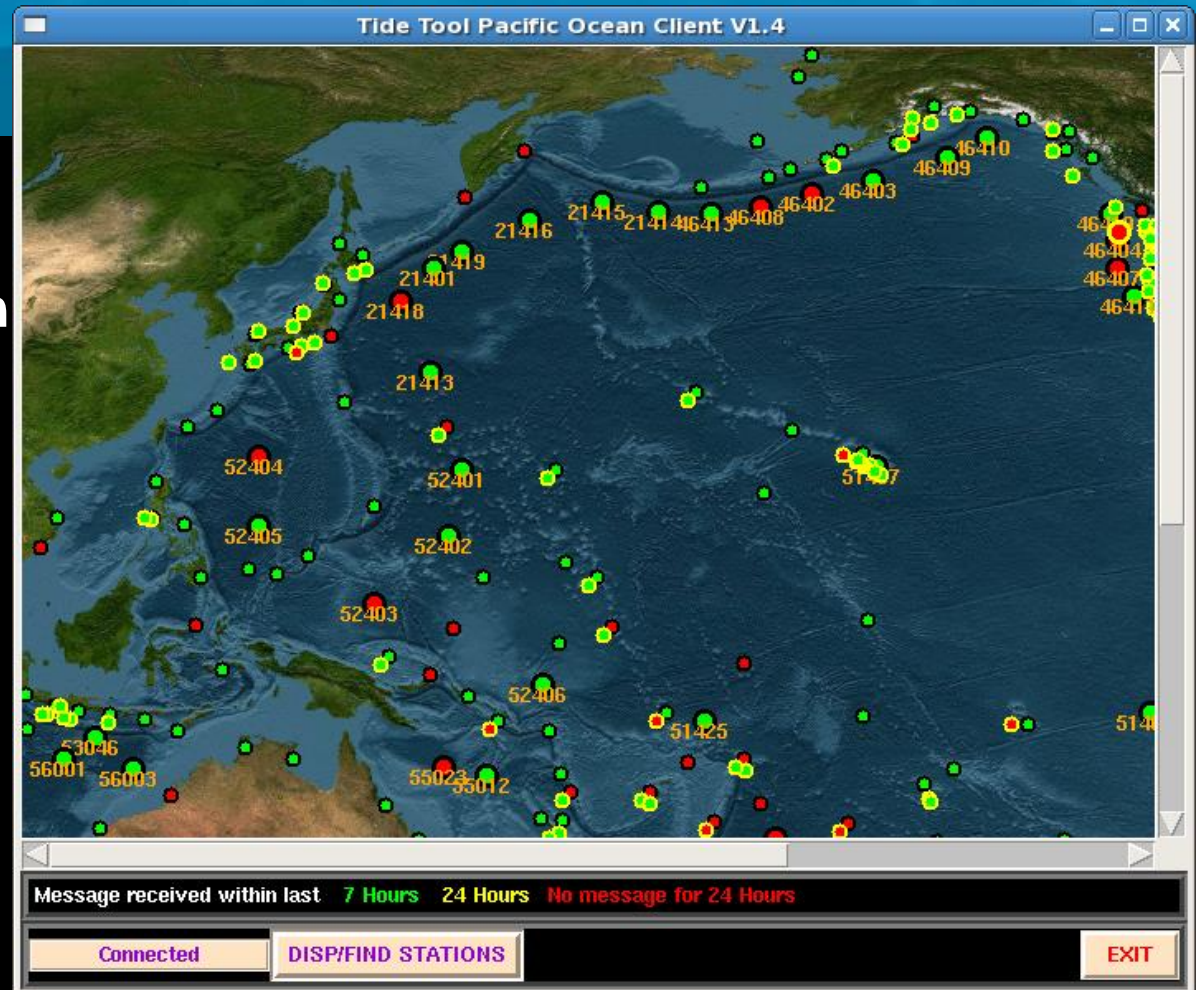

# Tide Tool Clients

# Clients are Interactive

- Send instructions to Decoder to display time series or other information
- Responds to mouse operations to display a single station or zoom in on a region and display multiple stations.
- Scrollable.
- Indicates station status (color).

# Tide Tool Clients

- Responds to mouse operations to display a single station or zoom in on a Region and display multiple stations.

- Locates stations by code or NDBC number (DARTS).

The screenshot displays the Tide Tool Client interface. It features a map of the Gulf of Mexico with various station markers. A list of station codes is visible on the right side of the interface, including:

MOBE	nafl
ocaj	ncla
acsp	pbfl
aal	pcfl
apfl	pemu
arec	pfla
octx	pitx
cori	pnfl
cule	posp
owfl	rptx
dat3	sanj
dcar	sigx
dgul	spfl
dial	sptx
dpen	stcr
dstl	stpt
ebla	tpfl
eila	tlla
faja	vieq
fbfl	vigu
fefl	

Below the map, there is a message received within last 7 Hours 24 Hours No m. A status bar shows 'Connected'. A menu is open with options: DISP/FIND STATIONS, SHOW NDBC IDs, SHOW STATION CODES, FIND STATION CODE (highlighted), and FIND NDBC ID.

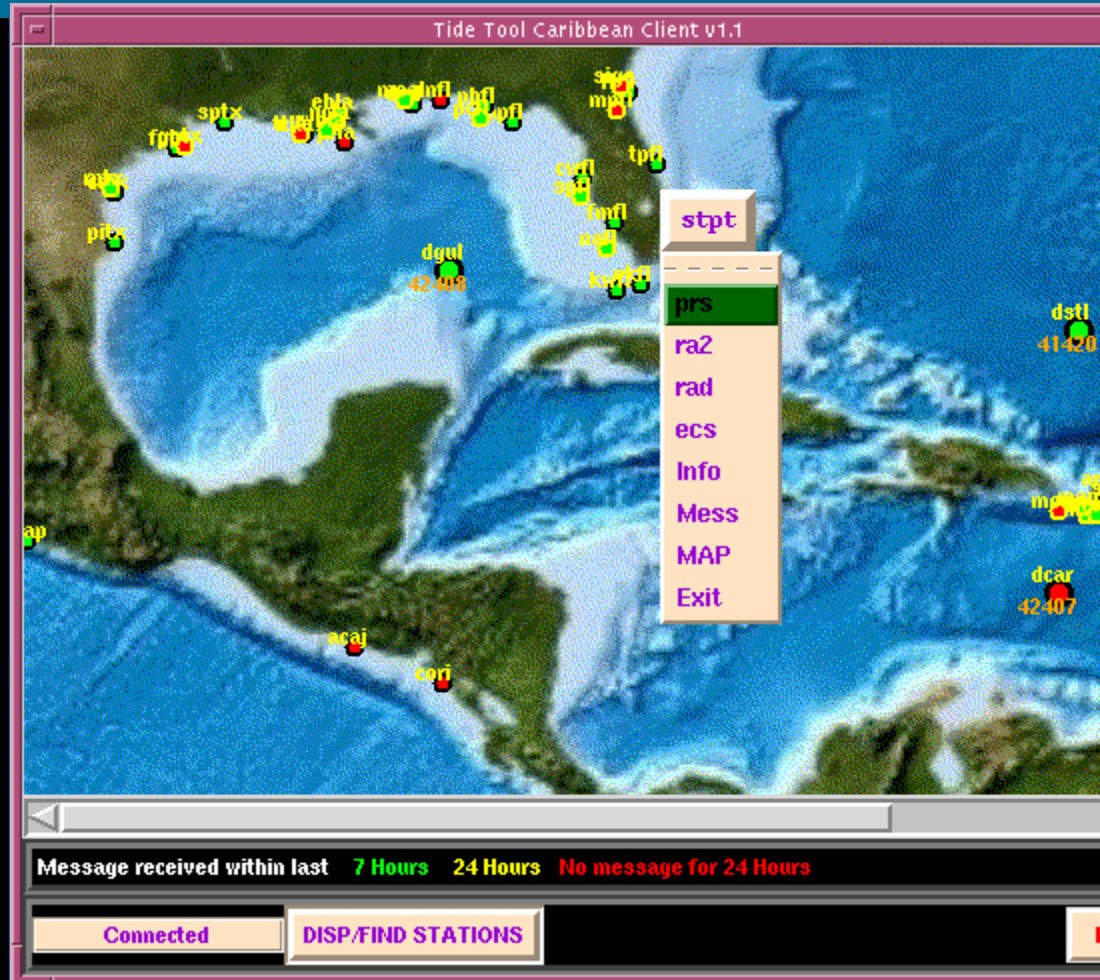

# Tide Tool Clients

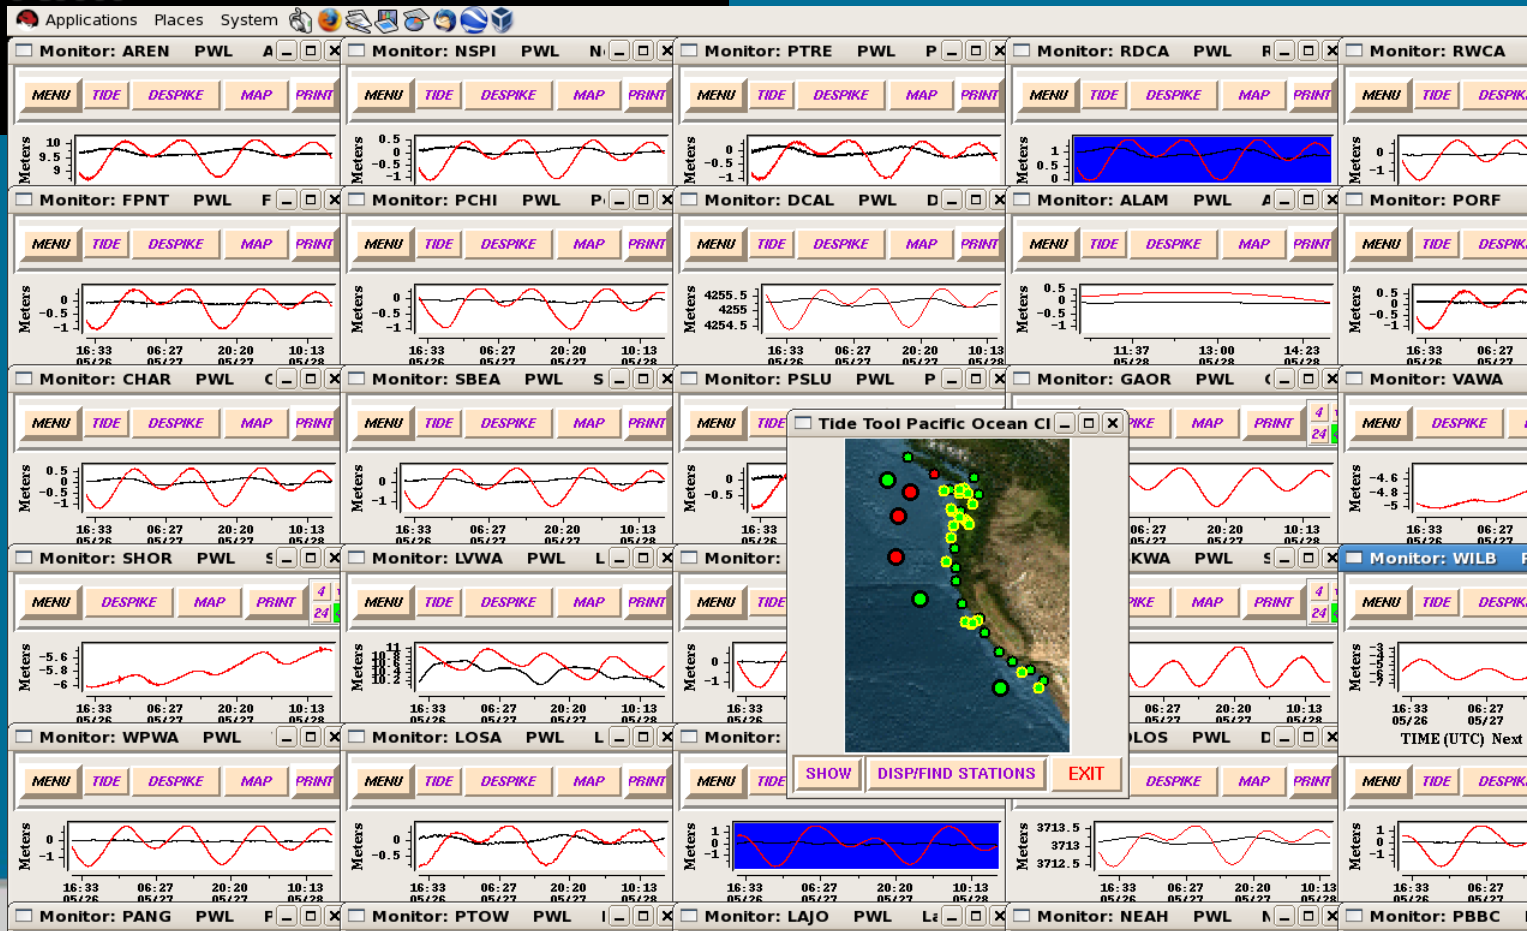

- Double click on a station  
Creates a button with a drop-down menu.
- Menu has selections to display time series for each sensor and widgets showing station info, recent GTS messages, and a geographic map of the nearby area with tsunami travel-times.

( Settlement Pt., Bahamas in this example. )

# Tide Tool Clients

- Draw a rectangle (rubber banding) to zoom in on a region and tile the screen OR....

# Tide Tool Clients

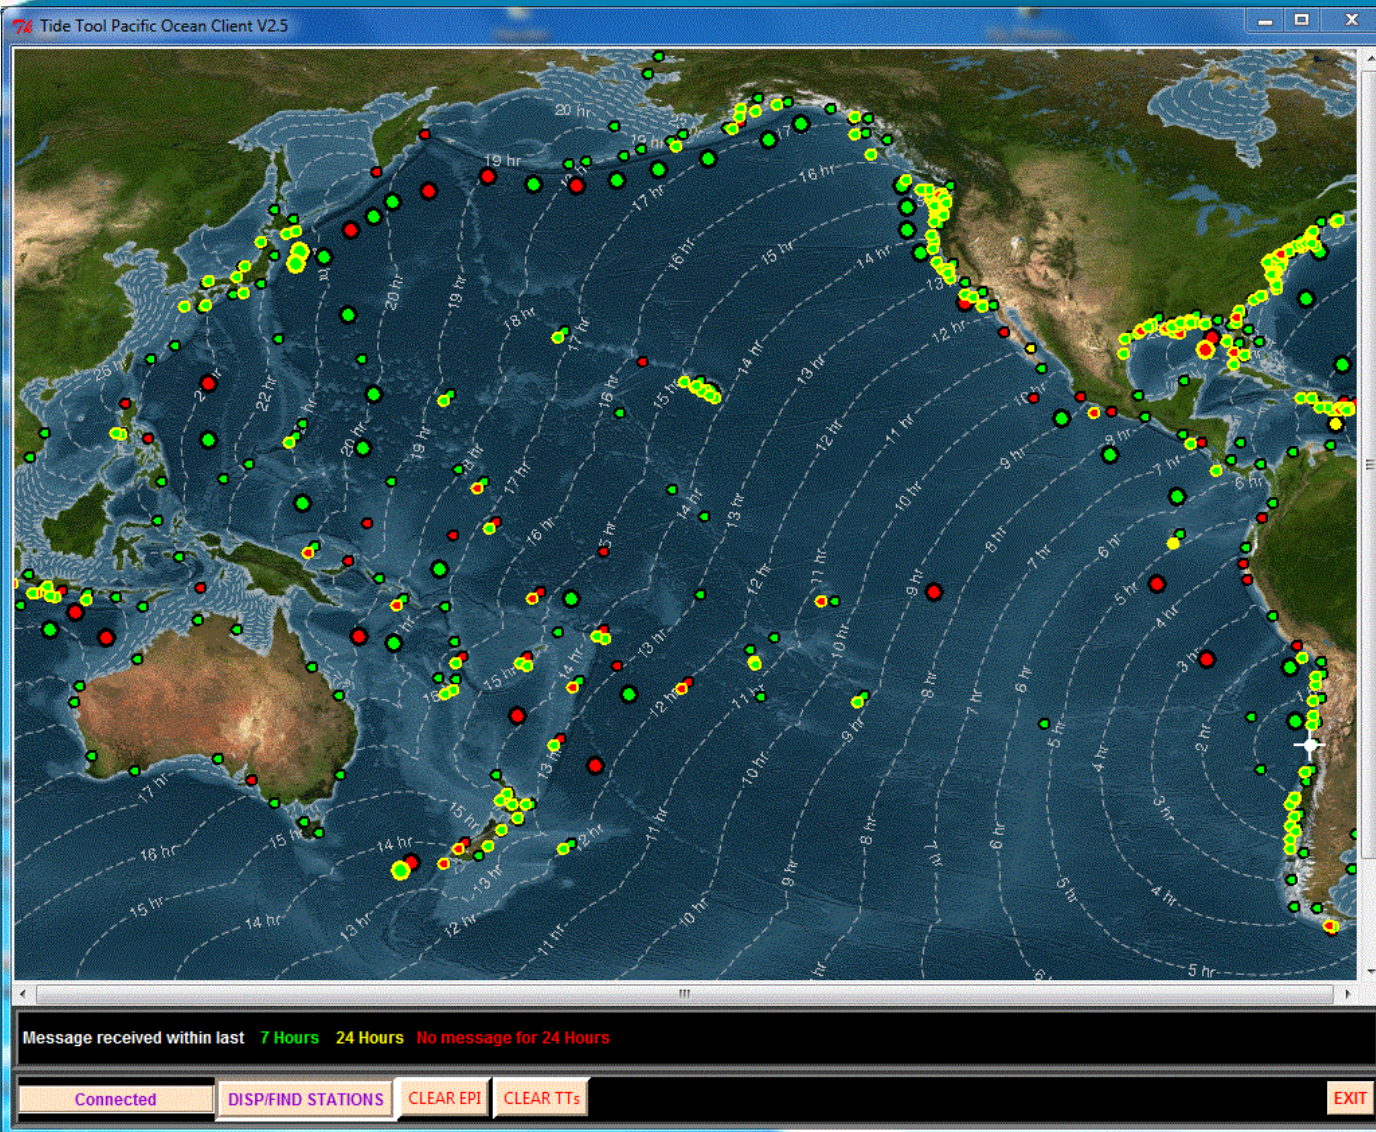

.... make a  
"Strip Chart Widget"

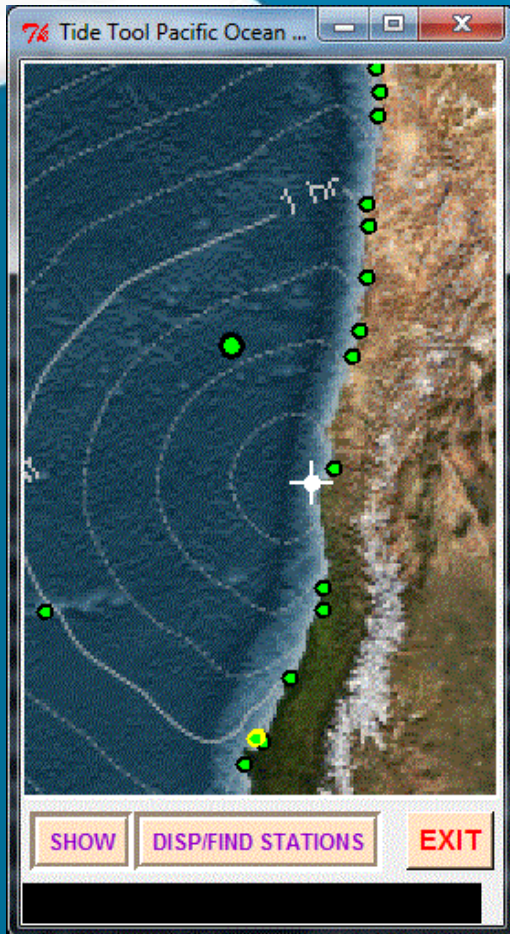

# Tide Tool & ETA's

Created with the  
ttd\_tidetool script

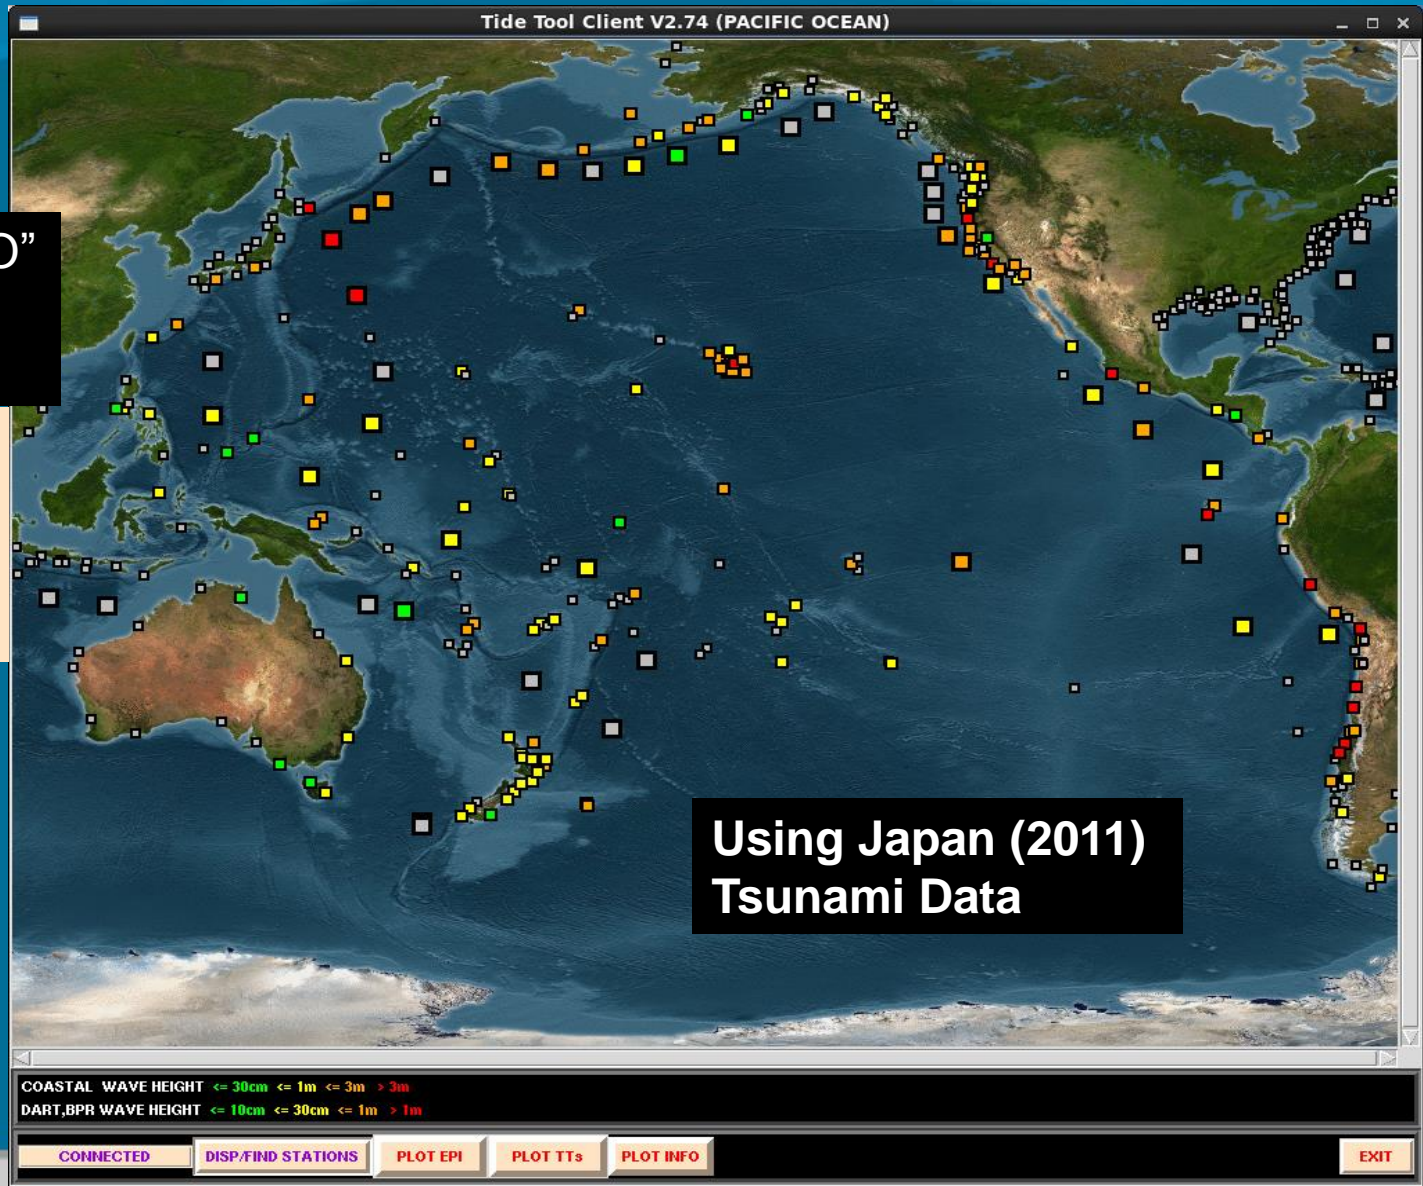

# Tide Tool & ETA's

Stations arranged in ETA order..

# Plotting Measurements

Clicking "PLOT INFO"  
Button creates this  
Menu:

- ✓ SHOW LATENCY
- SHOW WAVE HEIGHT
- SHOW WAVE AMPLITUDE
- SHOW WAVE PERIOD
- ERASE OBS

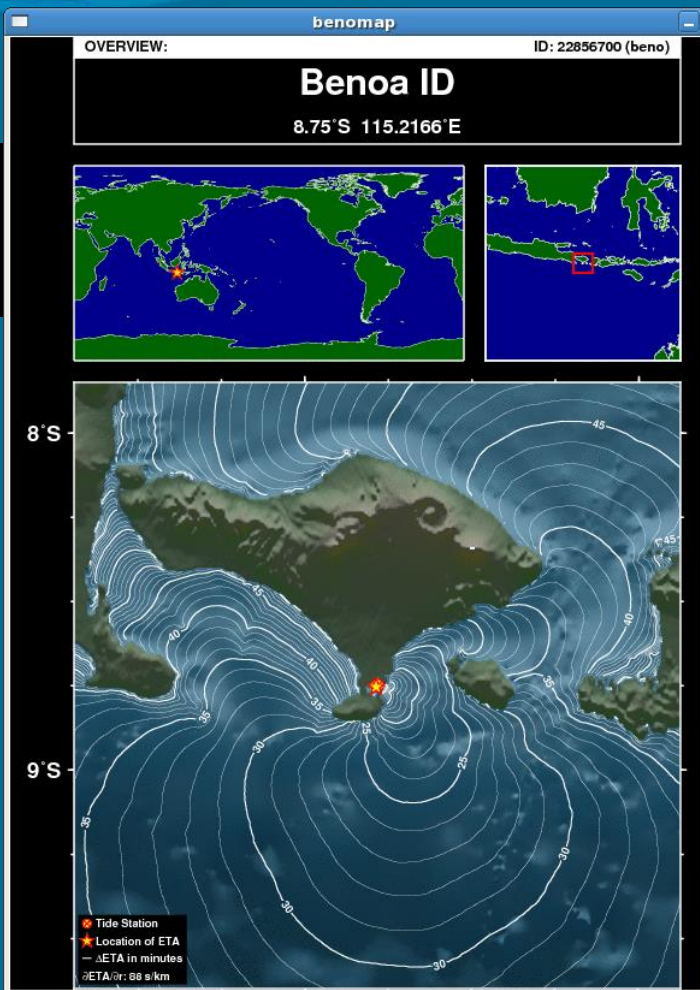

# Other Features

Tide Tool will decode historical GTS logfiles provided the correct Metadata is available.

Tide Tool will write files containing decoded data in a simple two column format:

```
102.48542 0001.300  
102.48611 0001.324  
102.48681 0001.333  
102.48750 0001.290
```

Tide Tool records wave measurements:

```
engg prs Peak to Peak 102/12 12:45 H -0.222 102/12 12:48 H 00.180 Per 00:03 Amp 00.402 2012149 15:13
```

# Tide Tool De-Tiding

For the purpose of accurate tsunami measurement it is important to remove the tide signal. Tsunamis have long enough periods that variations in sea-level can significantly affect the measurement of Tsunamis from marigrams. On the marigram, the tsunami will “ride the tide” affecting the precision of measurement.

Tide Tool uses two methods for de-tiding. One method is based on *permanent* coefficients\* (long term prediction) determined (Foreman’s method) from long time series (years). The other method, “on-the-fly” (short term prediction), uses non-static coefficients determined using recent (previous few days) data (Wang, 2009).

**\*PTWC maintains a set of permanent coefficients and these are available for distribution with Tide Tool**

# Tide Tool De-Tiding

## Long Term Prediction (Permanent Coefficients)\*

- Interactive (matlab) harmonic analysis of tide records of one year or longer (raw 3-6 min. or processed hourly data).
- Built-in de-spiking algorithm and quality control, and visual inspection.
- 67 of the Foreman's astronomical constituents are used in the analysis.

## Short Term or On-The-Fly Prediction

- Using latest data (as short 2-3 hours and up to 5 days of data).
- Same method as above except fewer constituents are used: Depending on the length of records, 1 to 10 constituents (with increasing periods) can be used.
- Limited de-spiking but without interactive quality control
- Detiding one station takes about one sec of cpu or less.

**\*PTWC maintains a set of permanent coefficients and these are available for distribution with Tide Tool**

# Tide Tool De-Tiding

## Long Term Prediction

**Harmonic analysis:** Least-square fit of 67 of Foreman's astronomical constituents to tide record of one year or longer (hourly means, or 3-6min data). If sampling interval is < 3min, it is resampled at 3-min or 4-6-min. In cases where quality of raw data is really poor, hourly mean data (NOS and UHSLC) are used.

Time series are despiked and smoothed if they appear noisy under visual inspection. After this formal harmonic analysis can be applied:

Least-square fit: minimization of L:

$$L = \sum_k \{ (\sum_i (A_i \cos(\omega_i T_k) + B_i \sin(\omega_i T_k)) - \text{tide\_obs}(T_k))^2 \}$$

where,  $T_k$ =time(k),  $A_i$  and  $B_i$  are harmonic coefficients,  $\omega(i)$  are frequencies of constituents.

# Tide Tool De-Tiding

## Short Term Prediction

- 1. Use the latest data (up to 5 days). If there are multiple sensors at a given station, the sensor with the most data is used for de-tiding (unless that data is of poor quality, in which case another sensor is used).**
- 2. De-spiking based on the distribution of data**
- 3. Harmonic analysis of de-spiked data: depending on the length of data, one or more constituents with periods typically less or comparable to the length of data are used.**
- 4. Number of harmonics considered depends on length of time series. The number of harmonics that gives the best fit in a least-squares sense is used.**

# Tide Tool De-Tiding

**Both de-tiding methods have strengths and weaknesses:**

## **Short Term Prediction\***

**Strengths:** Does not require long time series and can therefore be used for new stations.

**Will eliminate non-gravitational effects.**

**Weakness:** Will not work well if data contains gaps or other defects.

**Coefficients need to be computed every few hours.**

**\*PTWC working on creating a pure Tcl script that computes the on-the-fly coefficients.**

# Tide Tool De-Tiding

**Both de-tiding methods have strengths and weaknesses:**

## **Long Term Prediction\***

**Strengths: De-tiding not affected by spikes or other defects in the data.**

**Weaknesses: Susceptible to non-gravitational effects.**

**Requires one or more years worth of data to compute coefficients that give correct phase well into the future.**

**\*PTWC maintains a set of permanent coefficients and these are available for distribution with Tide Tool**

# Future Directions

1. “On The Fly” Tide Modeling distributed with Tide Tool
2. Band-pass filtering

# Sample Tsunamis...

Observations from Chile Dec. 25, 2016

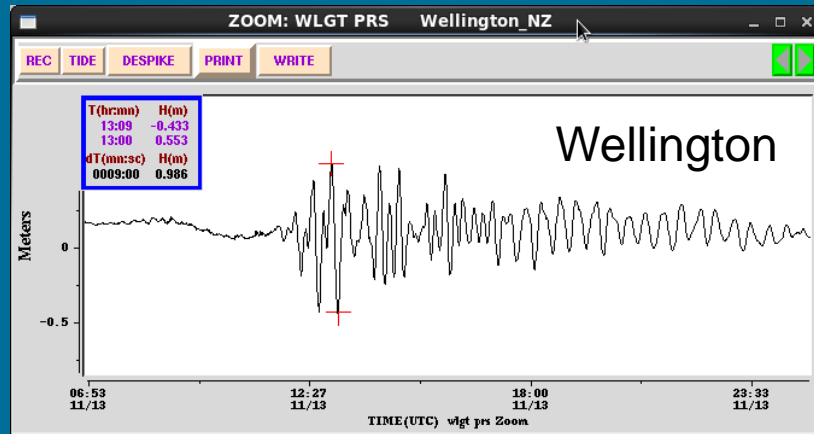

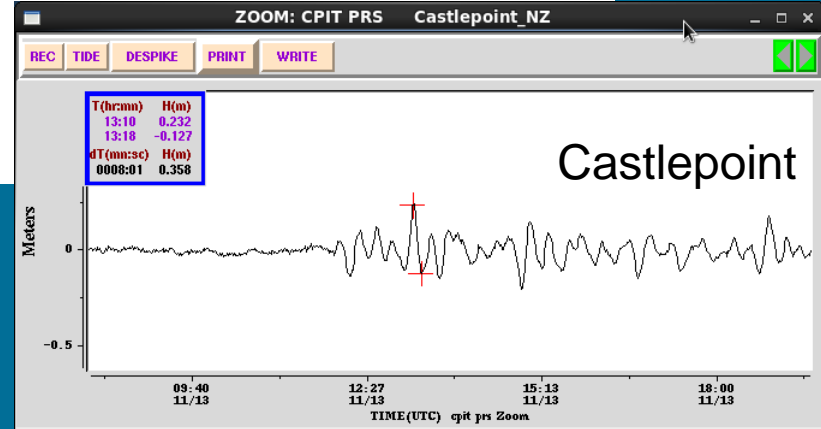

Tsunami had unusually long period (60-90 minutes) at several stations. Largest at Castro T2P 97cm.

# Sample Tsunamis...

## New Zealand Quake 11/13/2016

Kaikoura showed maximum amplitude. Also note the static uplift of Kaikoura due the earthquake.

# Updates (FTP site)

Updates will be posted to the UHSLC anonymous FTP server:

`ilikai.soest.hawaii.edu`

Login with anonymous FTP  
`cd ptwc`

Or via the web:

<http://www.ilikai.soest.hawaii.edu/ptwc>

Thank You!

You may need to edit your Tide.tcl file in C:\Tcl\bin. Notepad or WordPad will work. Find the line: “set USE\_LOG 0”

=> Change the 0 to a 1, “set USE\_LOG 1”

Also the FTP site is now:

[ftp.soest.hawaii.edu](ftp://soest.hawaii.edu)

NOT [ilikai.soest.hawaii.edu](ftp://ilikai.soest.hawaii.edu)
